

THE ULTIMATE WEATHER PROTECTION

lighter, warmer, dryer: in all weather

84% thermal efficiency: the secret of the Francital range

In the mountains or the polar regions, the body is the only source of heat. A garment must retain as close to 100% of this heat as possible, but allow the evacuation of chilling condensation. It is also vital to prevent cooling, and thus wind and wet protection must also be built-in, and guaranteed by rip-proof material, for a leak could be fatal.

Jackets and overalls must also allow ease of movement: bulky duvet jackets are tiring and reduce performance - Francital reduces bulk by associating 4 space age materials - nylon, polyester, plastic and aluminium (see diagram), for an overall weight of under 2 pounds.

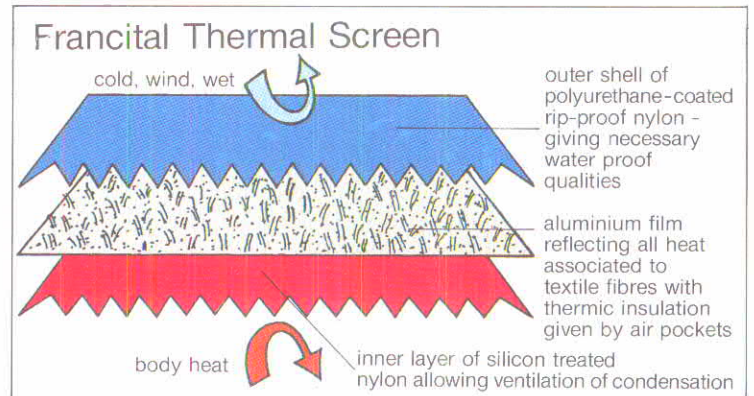

The Francital jackets and overalls are unique. Designed by the professionals whose life may depend on the functional qualities of the garments, every detail has been completely researched, and the overall performance is guaranteed by an individually numbered warranty.
